AbstractID: 13377 Title: Evaluation of viewing angle performance on the latest high-brightness color LCD monitors with the in-plane switching panel for medical images

Purpose: Our purpose was to compare the viewing angle performance on high-brightness color liquid-crystal display (LCD) monitors to that of monochrome LCD monitors.

Method and Materials: We used four LCD monitors with an in-plane switching (IPS) panel: two high-brightness color LCD monitors (RX211, $300 \mathrm{~cd} / \mathrm{m}^{2}$, two-megapixel, Eizo, and RX210, $240 \mathrm{~cd} / \mathrm{m}^{2}$, two-megapixel, Eizo), and two monochrome LCD monitors, (GS220, $500 \mathrm{~cd} / \mathrm{m}^{2}$, two-megapixel, Eizo, and G31-S, $450 \mathrm{~cd} / \mathrm{m}^{2}$, three-megapixel, Eizo). The luminance performance of each LCD monitor was measured as a function of the viewing angle $\left(-60^{\circ}\right.$ to $\left.+60^{\circ}\right)$ in the horizontal, the vertical, and the diagonal directions by use of a telescopic-type luminance meter without any ambient lighting. The viewing angle performance was evaluated with a relative contrast ratio of $70 \%$ or greater.

Results: The range of viewing angle in terms of relative contrast ratio on the $300 \mathrm{~cd} / \mathrm{m}^{2}$ high-brightness color, the $240 \mathrm{~cd} / \mathrm{m}^{2}$ high-brightness color, the $500 \mathrm{~cd} / \mathrm{m}^{2}$ two-megapixel monochrome, and the $450 \mathrm{~cd} / \mathrm{m}^{2}$ three-megapixel monochrome LCD monitors with similar IPS panels were $34^{\circ}$ to $74^{\circ}, 29^{\circ}$ to $48^{\circ}, 55^{\circ}$ to $81^{\circ}$, and $39^{\circ}$ to $74^{\circ}$, respectively. The relative contrast ratios showed notable variations for different viewing angles in spite of similar types of panels. Our results indicate that the viewing angle performance on the $240 \mathrm{~cd} / \mathrm{m}^{2}$ color LCD monitor tended to provide a slightly inferior angular performance to the two monochrome LCD monitors used in this study. On the other hand, the $300 \mathrm{~cd} / \mathrm{m}^{2}$ color LCD monitor had a comparable viewing angle performance with the 450 $\mathrm{cd} / \mathrm{m}^{2}$ monochrome LCD monitor.

Conclusion: The viewing angle performance on the high-brightness color LCD monitors is inferior to that of monochrome LCD monitors. However the $300 \mathrm{~cd} / \mathrm{m}^{2}$ color LCD monitor had comparable viewing angle performance with the $450 \mathrm{~cd} / \mathrm{m}^{2}$ monochrome LCD monitor.
