

The Effects of Motion on IMRT: Methods to alleviate IMRT motion effect errors

Daniel Low, Ph.D. Washington University
Paul Keall, Ph.D. Virginia Commonwealth University
Thomas Bortfeld, Ph.D. Massachusetts General Hospital
Thanks to Steve Jiang and Rohini George for slides

What have those guys been trying to tell me?

The Effects of Motion on IMRT

12

Organ motion

- Occurs while the patient is being irradiated
- Caused by respiration motion, cardiac motion and the digestive system
- Methods to account for intra-fraction motion
 - Respiratory gating techniques
 - Active breathing control (ABC)
 - Deep Inspiration breath hold (DIBH)
 - Voluntary breath hold (VBH)
 - Dynamic tumor tracking/4D radiotherapy
 - Abdominal compression?

The Effects of Motion on IMRT

13

Respiratory gating

Respiratory Gating

The Effects of Motion on IMRT

15

Respiratory Gating

- Radiation delivery synchronized with the respiratory signal
- A reflective marker block is placed on the patient to detect respiration motion (or internal fiducial markers)
- Marker blocks are illuminated by infrared emitting diodes
- Software tracks the position of the marker

The Effects of Motion on IMRT

16

Respiratory Gating Advantages and disadvantages

- Advantages
 - Reduction in volume of normal tissue irradiated
 - Fewer motion artifacts in CT scan
 - Patients do not need to hold breath
- Disadvantages
 - Residual motion within gating window
 - Not robust to baseline shifts
 - Treatment time increases

The Effects of Motion on IMRT

17

Breath hold techniques

Active Breathing Control (ABC)

- Temporarily immobilizes patients breathing
- The inspiration and expiration paths of airflow are closed at a predetermined flow direction
- Figure shows ventilator which was used for ABC (modified Servo Ventilator 900C)

Wong et al IJROBP Vol. 44 pp 911-919

The Effects of Motion on IMRT

19

Airflow and lung volume

- Airflow and lung volume during normal breathing and ABC level
- ABC in this case activated for 10 s

The Effects of Motion on IMRT

Wong et al IJROBP Vol. 44 pp 911-919

20

CT scans

- Acquired during normal breathing
- Acquired with ABC applied for 43 s during deep inspiration
- During ABC at the same deep inspiration phase but 30 min later

Wong et al IJROBP Vol. 44 pp 911-919

The Effects of Motion on IMRT

21

Deep Inspiration Breath Hold (DIBH)

- DIBH involves coaching the patient to reproduce deep inspiration level during simulation, radiation treatment and port film verification

The Effects of Motion on IMRT

Rosenzweig et al IJROBP Vol. 48 pp 81-87

22

Spirometry tracing

- Quiet tidal breathing initially established
- Verbal coaching
 - Slow deep inspiration
 - Slow deep expiration and then
 - A second slow deep inspiration and then
 - Breath hold

Rosenzweig et al IJROBP Vol. 48 pp 81-87

The Effects of Motion on IMRT

23

Set-up for DIBH

- Patient is placed in supine position in an immobilization device
- Patient is connected to a spirometer
- Nose clips are attached to prevent nasal breathing

Rosenzweig et al IJROBP Vol. 48 pp 81-87

The Effects of Motion on IMRT

24

Breath hold

Advantages and disadvantages

➤ Advantages

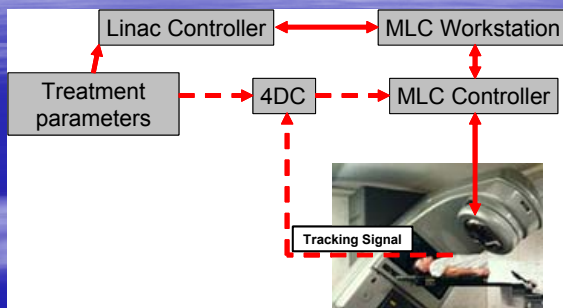

- Reduction in volume of normal tissue irradiated
 - Reduction in internal motion, and
 - Reduction in fractional lung irradiated/increase in heart-chest wall separation
- Fewer motion artifacts in CT scan

➤ Disadvantages

- Treatment time increases
- Patient compliance
- Internal motion during breath hold
