TMRU 1 

2011 Joint AAPM/COMP Meeting (Imaging Educational Course - Ultrasound II: Current State and Future of Ultrasound) - August 01, 2011

TOSHIBA
Leading Innovation >>>

OUTLINE

- **Introduction**
 - Quantitative ultrasound imaging
- **Technology and clinical applications**
 - **I. Wall Motion Tracking**
 - Cardiology: analysis of the cardiac function
 - **II. Tissue Characterization**
 - Radiology: degree of liver fibrosis
 - **III. Contrast Enhanced Ultrasound**
 - Oncology: tumor response to therapy
- **Conclusion**
 - Summary
 - Future trends

TMRU 2 

2011 Joint AAPM/COMP Meeting (Imaging Educational Course - Ultrasound II: Current State and Future of Ultrasound) - August 01, 2011

TOSHIBA
Leading Innovation >>>

INTRODUCTION

- **Objective of quantification**
 - Objective measurement of tissue pathological state by medical imaging plays an increasing role in clinical practice
- **Quantitative ultrasound imaging**
 - Ultrasound imaging modality offers dedicated solutions based on signal- or image-derived quantitative measurements for evaluating a variety of diseases in cardiology, radiology and oncology

TMRU 3 

2011 Joint AAPM/COMP Meeting (Imaging Educational Course - Ultrasound II: Current State and Future of Ultrasound) - August 01, 2011

I. WALL MOTION TRACKING

Y. Abe, H. Ohuchi, T. Kawagishi, *Two and three dimensional wall motion analysis*, White Paper Toshiba Medical Review TMR 0805-1.

TMRU 4 

2011 Joint AAPM/COMP Meeting (Imaging Educational Course - Ultrasound II: Current State and Future of Ultrasound) - August 01, 2011

TOSHIBA Leading Innovation >>> **I. WALL MOTION TRACKING**

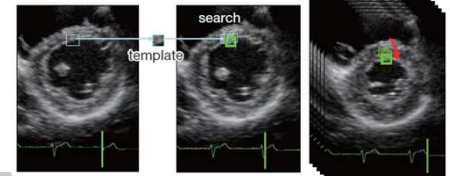

- **Medical context**
 - **Echocardiography:** cardiac ultrasound imaging
 - **Analysis of the cardiac function** based on heart motion conceived as an aid to assessment of
 - Ischemia
 - Dyssynchrony
 - Heart failure
 - etc.

TMRU 5 

2011 Joint AAPM/COMP Meeting (Imaging Educational Course - Ultrasound II: Current State and Future of Ultrasound) - August 01, 2011

TOSHIBA Leading Innovation >>> **I. WALL MOTION TRACKING**

- **Wall Motion Tracking Technology**
 - **Speckle tracking methods based on frame-to-frame correlation**
 - **Process**
 - Create template image in a local region in the starting frame
 - Search for local speckle pattern matching the template in the next frame
 - Derive a movement vector based on the displacement of the region
 - Repeat the process on all frames of one cardiac cycle

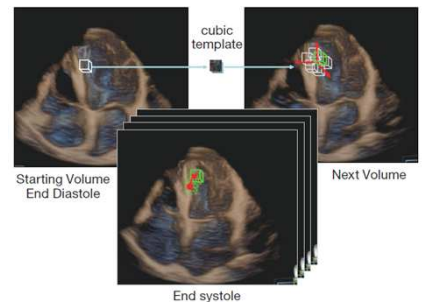

TMRU 6 

2011 Joint AAPM/COMP Meeting (Imaging Educational Course - Ultrasound II: Current State and Future of Ultrasound) - August 01, 2011

TOSHIBA Leading Innovation >>> **I. WALL MOTION TRACKING**

- **Wall Motion Tracking Technology**
 - Same technique used in 2D applied to 4D data by tracking 3 dimensional cubic templates through the cardiac cycle

TMRU 7 

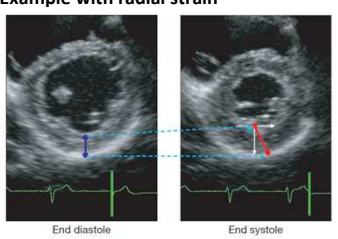

2011 Joint AAPM/COMP Meeting (Imaging Educational Course - Ultrasound II: Current State and Future of Ultrasound) - August 01, 2011

TOSHIBA Leading Innovation >>> **I. WALL MOTION TRACKING**

- **Strain calculation based on tracking results**
 - **Strain is the measurement of deformation**

$$\text{Strain} = \frac{(L - L_0)}{L_0} \times 100 \text{ [%]}$$

- **Example with radial strain**

Relative displacement perpendicular to the endocardium in the short axis view

$$\text{Radial Strain} = \frac{(L_r - L_{r_0})}{L_{r_0}} \times 100 \text{ [%]}$$

TMRU 8 

2011 Joint AAPM/COMP Meeting (Imaging Educational Course - Ultrasound II: Current State and Future of Ultrasound) - August 01, 2011

TOSHIBA Leading Innovation >>> **I. WALL MOTION TRACKING**

- **Strain calculation based on tracking results**
 - Strain in different directions for assessment of cardiac motion

Short axis view Apical view

TMRU 9

2011 Joint AAPM/COMP Meeting (Imaging Educational Course - Ultrasound II: Current State and Future of Ultrasound) - August 01, 2011

TOSHIBA Leading Innovation >>> **I. WALL MOTION TRACKING**

- **Strain calculation based on tracking results**
 - 3-dimensional data offers a comprehensive assessment of the cardiac function

a) Conventional Strain b) Radial 3D strain c) Torsion

TMRU 10

2011 Joint AAPM/COMP Meeting (Imaging Educational Course - Ultrasound II: Current State and Future of Ultrasound) - August 01, 2011

TOSHIBA Leading Innovation >>> **I. WALL MOTION TRACKING**

- **Parametric imaging of strain**
 - Rendering of the spatial distribution of strain using color coding
 - Ultrasound system: Toshiba Artida

Normal case Apical infarction

Circumferential strain

II. TISSUE CHARACTERIZATION

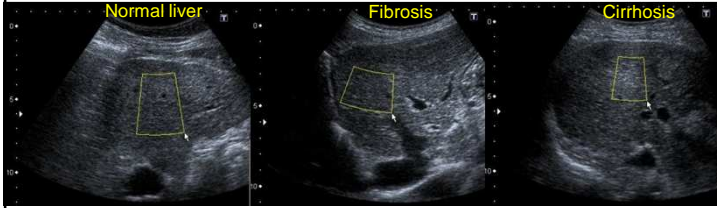

H. Toyoda, T. Kumada, N. Kamiyama, K. Shiraki, K. Takase, T. Yamaguchi, H. Hachiya, *B-Mode Ultrasound With Algorithm Based on Statistical Analysis of Signals: Evaluation of Liver Fibrosis in Patients With Chronic Hepatitis C*, AJR Am J Roentgenol., 193(4):1037-43, 2009.

TMRU 12

2011 Joint AAPM/COMP Meeting (Imaging Educational Course - Ultrasound II: Current State and Future of Ultrasound) - August 01, 2011

TOSHIBA Leading Innovation >>> **II. TISSUE CHARACTERIZATION**

- **Principle**
 - Tissue characterization consists in differentiating subtle changes in ultrasound speckle patterns, indicative of the tissue microstructures, which remain non perceptible to human visual inspection
- **Clinical problem**
 - Evaluation of the degree of liver fibrosis in patients

TMRU 13 

2011 Joint AAPM/COMP Meeting (Imaging Educational Course - Ultrasound II: Current State and Future of Ultrasound) - August 01, 2011

TOSHIBA Leading Innovation >>> **II. TISSUE CHARACTERIZATION**

- **Speckle analysis**
 - **Definition of ultrasound speckle:**
 - Granular pattern in images formed with coherent radiation of scatterers
 - **When size of tissue structures < wavelength**
 - Probability Density function of echo amplitude = Rayleigh distribution
 - **Rayleigh distribution approximation**
 - Typical of normal liver tissues (homogenous speckle pattern)
 - No longer valid in fibrotic liver tissues because size of nodules and fibrous structures > wavelength
- **Clinical context**
 - Speckle changes from homogeneous to heterogeneous with progression of liver fibrosis towards cirrhosis
 - Difficult to assess echo amplitude statistics by visual observation
 - Quantitative method of evaluating liver fibrosis would be useful

TMRU 14 

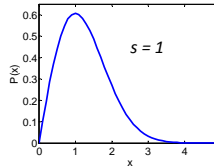

2011 Joint AAPM/COMP Meeting (Imaging Educational Course - Ultrasound II: Current State and Future of Ultrasound) - August 01, 2011

TOSHIBA Leading Innovation >>> **II. TISSUE CHARACTERIZATION**

- **Rayleigh distribution**

$$P(x) = \frac{x}{s^2} e^{-x^2/(2s^2)}$$

x : echo amplitude
 s : scale parameter

Mean: $\mu = s\sqrt{\frac{\pi}{2}}$ Variance: $\sigma_R^2 = \frac{4-\pi}{2} s^2 \Rightarrow \sigma_R^2(\mu) = \left(\frac{4-\pi}{\pi}\right) \mu^2$
- **Chi-square test**
 - Determine whether a difference exists between the measured variance σ^2 and the ideal variance of Rayleigh distribution
$$C^2 = \frac{\sigma^2}{\sigma_R^2}$$

σ^2 : measured variance
 σ_R^2 : ideal variance for homogenous speckle pattern

$C^2 = 1$ means normal liver tissue

TMRU 15 

2011 Joint AAPM/COMP Meeting (Imaging Educational Course - Ultrasound II: Current State and Future of Ultrasound) - August 01, 2011

TOSHIBA Leading Innovation >>> **II. TISSUE CHARACTERIZATION**

- **Modified Chi-square test**
 - Introduction of a threshold α to remove local structures (thin vessels or specular reflectors) from the statistical analysis
 - Only echo-amplitude samples $< \mu + \alpha\sigma$ are selected

Modified variance: $\sigma_m^2 = \frac{1}{N_m} \sum_{x_i < \mu + \alpha\sigma} (x_i - \mu)^2$ Modified mean: $\mu_m = \frac{1}{N_m} \sum_{x_i < \mu + \alpha\sigma} x_i$

Modified C_m^2

$$C_m^2 = \frac{\sigma_m^2}{\sigma_R^2(\mu_m)} = \left(\frac{\pi}{4-\pi}\right) \frac{\sigma_m^2}{\mu_m^2}$$

x_i : echo amplitude
 α : removal threshold
 N_m : Number of selected samples

$$\sigma_R^2(\mu_m) = \left(\frac{4-\pi}{\pi}\right) \mu_m^2$$

TMRU 16 

2011 Joint AAPM/COMP Meeting (Imaging Educational Course - Ultrasound II: Current State and Future of Ultrasound) - August 01, 2011

TOSHIBA Leading Innovation >>> **II. TISSUE CHARACTERIZATION**

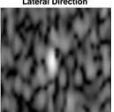

- **Determination of the removal threshold α**
 - Agar phantom mimicking three types of tissue structure

Lateral Direction

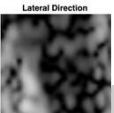

Homogeneous

Lateral Direction

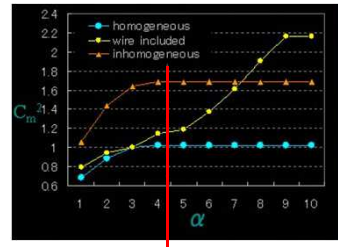

Wire included

TOSHIBA Leading Innovation >>> **II. TISSUE CHARACTERIZATION**

- **Validation for Patients with Chronic Hepatitis C**

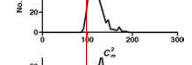

Agar phantom

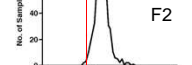

F1

F2

F3

Fibrosis grades:
F0 = no, F1 = mild, F2: moderate, F3: severe

Patient database:
148 patients with histologically proven chronic hepatitis C

19 

Imaging Educational Course - Ultrasound II: Current State and Future of Ultrasound - August 01, 2011

TOSHIBA Leading Innovation >>> **II. TISSUE CHARACTERIZATION**

- **Summary**
 - In B-mode images, speckle pattern changes from homogeneous to heterogeneous with progression of liver fibrosis
 - Quantification of homogeneity based on statistical chi-square test of the echo amplitude
 - Ratio between the measured variance and the ideal variance (Rayleigh distribution)

$$C_m^2 = \frac{\sigma_m^2}{\sigma_R^2(\mu_m)}$$
 - C_m^2 histogram obtained from multiple secondary ROIs (automatic) within a primary ROI (manual)
 - Base on the analyses on 148 patients, mode of C_m^2 histogram may reflect the progression of liver fibrosis

III. CONTRAST ENHANCED ULTRASOUND

21 

2011 Joint AAPM/COMP Meeting (Imaging Educational Course - Ultrasound II: Current State and Future of Ultrasound) - August 01, 2011

TOSHIBA
Leading Innovation >>>

III. CONTRAST ENHANCED ULTRASOUND

- **Clinical context**
 - Dynamic Contrast Enhanced Ultrasound (DCE-US) utilizes an intravenous injection of microbubble contrast agent, which supports ultrasound imaging of macro-vascularization
 - DCE-US has become an established technique for characterizing focal lesion in liver (Europe)
 - D-CEUS technique is a promising application for monitoring tumor response to cancer therapies
- **Perfusion quantification**
 - Approach uses a mathematical function to model the contrast uptake (or time-intensity-curve) in a region of interest outlining a tumor
 - Derived quantitative parameters are indicative of blood flow dynamics, which are expected to vary during the course of the therapy

22 

2011 Joint AAPM/COMP Meeting (Imaging Educational Course - Ultrasound II: Current State and Future of Ultrasound) - August 01, 2011

TOSHIBA
Leading Innovation >>>

III. CONTRAST ENHANCED ULTRASOUND

- **Example in small animals**
 - Radiofrequency ablation in rat subcutaneous model tumor model
 - Ultrasound system: Toshiba Aplio

Leading Innovation >>>

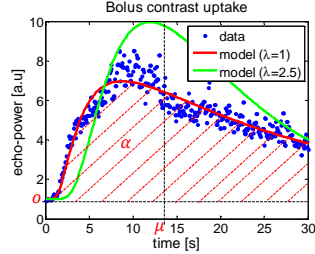

III. CONTRAST ENHANCED ULTRASOUND

- **Bolus contrast uptake (modeling)**
 - **Perfusion model:** Local Density Random Walk function^{1,2}

$$f(t) = o + \alpha \left(\frac{e^\lambda}{\mu} \right) \left(\frac{\lambda}{2\pi} \right)^{1/2} \left(\frac{\mu}{t} \right)^{1/2} e^{-\frac{1}{2}\lambda \left(\frac{\mu+t}{\mu} \right)}$$

with

- f : perfusion model
- t : time variable
- o : baseline
- α : area under the curve
- λ : skewness
- μ : transit time

24 

2011 Joint AAPM/COMP Meeting (Imaging Educational Course - Ultrasound II: Current State and Future of Ultrasound) - August 01, 2011

TOSHIBA Leading Innovation >>> **III. CONTRAST ENHANCED ULTRASOUND**

- **ImageLab (research software program)¹**
 - Derive Time Intensity Curves (TICs) within Regions of Interest (ROIs) from a sequence of ultrasound contrast images, acquired on TOSHIBA Aplio/Xario ultrasound systems

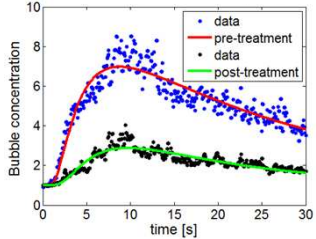

TMRU 1. Developed by Naohisa Kamiyama, PhD - TOSHIBA Medical Systems Corporation Corp. 25

2011 Joint AAPM/COMP Meeting (Imaging Educational Course - Ultrasound II: Current State and Future of Ultrasound) - August 01, 2011

TOSHIBA Leading Innovation >>> **III. CONTRAST ENHANCED ULTRASOUND**

- **Example of perfusion quantification**

Blood volume reduction in tumor (post treatment) = 47%

TMRU 26

2011 Joint AAPM/COMP Meeting (Imaging Educational Course - Ultrasound II: Current State and Future of Ultrasound) - August 01, 2011

TOSHIBA Leading Innovation >>> **III. CONTRAST ENHANCED ULTRASOUND**

- **Example of current clinical research in oncology**
 - Evaluation of tumor response to drug therapies by the Institut Gustave-Roussy (Paris, France)
 - N. Lasseau et al., *Advanced Hepatocellular Carcinoma: Early Evaluation of Response to Bevacizumab Therapy at Dynamic Contrast-enhanced US with Quantification — Preliminary Results*, Radiology, 258(1):291:300, 2011
 - Protocol (42 patients)
 - DCE-US performed before and after treatment (3, 7, 14 and 60 days)
 - Measurement of TIC in the tumor using CHI-Q quantification software (Toshiba)
 - Estimate of parameters from TIC by fitting a dedicated perfusion model
 - Findings
 - Changes in tumor vascularity can be detected after treatment
 - DCE-US may be useful for quantifying tumor response to therapy
 - Perfusion quantification is a promising tool for predicting tumor response and measure the effectiveness of therapy

TMRU 27

2011 Joint AAPM/COMP Meeting (Imaging Educational Course - Ultrasound II: Current State and Future of Ultrasound) - August 01, 2011

TOSHIBA Leading Innovation >>> **CONCLUSION**

- **Summary**
 - Quantification in ultrasound imaging offers objective measurements of variety of diseases
 - Wall Motion Tracking for the analysis of the cardiac function
 - Tissue Characterization for assessing degree of liver fibrosis
 - Contrast Enhanced Ultrasound for evaluating tumor response to therapy
- **Future trends**
 - **Ultrasound molecular imaging**
 - Detect molecular markers that are hallmarks of disease on the intravascular endothelium (eg. vascular endothelial growth factor: VEGF)
 - Targeted microbubbles: ligand attached to the surface of the shell
 - Imaging of tumoral angiogenesis by active targeting
 - **Drug delivery**
 - Incorporation of a drug in microbubbles for local delivery to a target site
 - Microbubbles can induce permeability of the endothelial layer, allowing to increase efficiency of drug delivery at the location of the US beam
